Template Tags/get permalink

Description

Returns the [permalink](#) to a post for use in [PHP](#). It does NOT display the permalink.

Usage

```
<?php get_permalink(id); ?>
```

Examples

Default Usage

The permalink for current post (used within [The Loop](#)). As the tag does not display the permalink, the example uses the PHP echo command.

```
Permalink for this post:<br />
<?php echo get_permalink(); ?>
```

Link to Specific Post

Returns the permalinks of two specific posts (post IDs 1 and 10) as hypertext links within an informational list. As above, tag uses the PHP echo command to display the permalink.

```
<ul>
<li>MyBlog info:
  <ul>
    <li><a href="<?php echo get_permalink(1); ?>">About MyBlog</a></li>
    <li><a href="<?php echo get_permalink(10); ?>">About the owner</a></li>
  </ul>
</li>
</ul>
```

Parameters

id

(*integer*) The numeric ID for a post. When this tag is used in [The Loop](#) without an id parameter value, tag defaults to the current post ID.
