Template Tags/wp title

Description

Displays or returns the title of the [Page](#). This tag can be used anywhere within a template as long as it's outside [The Loop](#) on the main page, though is typically used in the <title> element for the head of a [Page](#).

- Page title always includes the blog name.
- If viewing a post, it includes the title of the post.
- If viewing an archive page, it includes the year and month for the archive.
- If viewing a category, it includes the category name.

Usage

```
<?php wp_title('sep', display); ?>
```

Examples

Default Usage

Displays page title using defaults.

```
<p>You are now at <?php wp_title(); ?>.</p>
```

Using Separator

Displays blog name (through [bloginfo\(\)](#)) along with page title in the document's title tag, using "--" as the separator. This results in (when on a single post page) **My Blog--Title of Post**.

```
<title><?php bloginfo('name'); ?><?php wp_title('--'); ?></title>
```

Separator with Blog Name and Title Reversed

This lets you reverse page title and blog name in the title tag from example above (**Title of Post--My Blog**) by removing the separator from wp_title(), then tests if wp_title() holds a value, and displays the separator between it and bloginfo() if it does.

```
<title>
<?php wp_title(' '); ?>
<?php if(wp_title(' ', false)) { echo '--'; } ?>
<?php bloginfo('name'); ?>
</title>
```

Parameters

sep

(*string*) Text to display between portions of the title (i.e. the separator), such as the archive elements of year and month. Defaults to `TRUE`. The separator text is placed before each title element, so when used in conjunction with the [`bloginfo\('name'\)`](#) tag, it should come after it. Defaults to `'»'` (`»`).

display

(*boolean*) Display the page title (`TRUE`), or return it for use in PHP (`FALSE`). Defaults to `TRUE`.
